SUMMARY

Backend engineer, four years in, who builds the parts where mistakes cost money: Paystack checkout with signature-verified webhooks, PayPal and manual-transfer payments for a client's course platform, and server-enforced multi-tenant isolation with regression tests. CEH-certified. Python, FastAPI, PostgreSQL.

PROFESSIONAL EXPERIENCE

Backend Engineer, *FUDS'* 01/2026 – Present | Remote

- Designed the backend for a multi-vendor food delivery and grocery subscription platform for the Lagos market (FastAPI, PostgreSQL, Redis, Celery), owning the API, data model, payments and background jobs behind an Expo mobile client.
- Modeled multi-vendor checkout as a parent order with vendor-specific child orders, so one cart is paid in a single transaction and split into per-vendor orders.
- Integrated Paystack card and bank-transfer payments with HMAC-SHA512-verified webhooks plus a client-side verify endpoint; a confirmed payment updates the parent order, child orders and linked scheduled meals.
- Built a Redis cart with a 3-day TTL, rehydrated from PostgreSQL on read and checkout so prices and vendor data are never stale; cached browse results in Redis.
- Implemented JWT auth with a Redis token blacklist on logout, bcrypt hashing, and email OTP with expiry and resend cooldown. Registration emails go out through Celery with exponential-backoff retries and an inline fallback if the broker is down.
- Built breakfast/lunch/dinner meal scheduling in the Africa/Lagos timezone, recurring grocery subscriptions (frequency changes, cancellation, checkout), and a revenue analytics endpoint with CSV export, covered by a pytest suite across auth, checkout, payments, schedules and email dispatch.

Web Developer & IT Security (Contract), *Cloudtalk Networks Limited* 06/2024 – 01/2026 | Lagos, Nigeria

- Modernized and maintained the company's telecommunications website, updating an aging web presence across product, service, contact, careers, and content-publishing pages.
- Maintained and extended PHP/MySQL functionality supporting contact submissions, newsletter registration, database-backed blog publishing, recruitment applications, and external service integrations.
- Strengthened endpoint and organizational security by configuring firewall protections and securing company workstations against unauthorized network access.
- Supported the organization's day-to-day technology operations, troubleshooting workstation, networking, and software issues and helping staff adopt safer and more effective technology practices.

Backend Developer & DevOps (Contract), *Konasalti Tech School* 07/2025 – 10/2025 | United States

- Built the backend for an online course platform (FastAPI, async SQLAlchemy, PostgreSQL, Alembic): catalog, enrollment, progress tracking, and an admin dashboard with CSV/PDF exports.
- Implemented authentication (bcrypt, JWT in HTTP-only cookies, Redis-backed verification and reset tokens) with separate user and admin auth.
- Built PayPal checkout and a manual bank/Zelle flow with admin approval, 50% flexible payments and promo codes, with payment state updated server-side only.

- Cut page load from 7s to 1.1s with a warm, timed Redis cache of course and user data.

SKILLS

Backend & APIs:
Python, FastAPI, Pydantic, async SQLAlchemy, Alembic, REST API design, pytest

Payments:
Paystack, Stripe, PayPal, signature-verified webhooks, subscriptions

DevOps
Docker, Docker Compose, GitHub Actions

Familiar with:
AWS EC2, NGINX, Cloudflare, DigitalOcean, MySQL

Data & Backend Systems:
PostgreSQL, Redis (caching, token stores), Celery

Authentication & Security:
JWT, OAuth2, RBAC, multi-tenant isolation, Argon2/bcrypt

Frontend:
React, TypeScript, React Native/Expo

SELECTED PROJECTS

Ree-fond, *Regulatory Compliance Workflow System*
FastAPI · PostgreSQL · async SQLAlchemy · Redis/Celery · React · Stripe
- Designed a multi-tenant backend where each request resolves an active organization, verifies membership and org-specific role overrides, and enforces permissions server-side across taxpayers, filings and refunds, with regression tests for tenant isolation.
- Built the refund lifecycle (submit, approve, reject, disburse, appeal, withdraw) with timelines and overdue tracking, plus filing workflows and compliance scoring with alerts and risk reports.
- Secured the API with JWT (Bearer or cookie), Argon2 hashing, Google OAuth and audit logging; added plan-based usage limits, Stripe checkout, and developer API keys, webhooks and request logs.
- Built the React control dashboard (organization switching, permission-aware routes) and a public product site.

KANEC Impact, *Donation platform with publicly verifiable transactions*
FastAPI · PostgreSQL · Hedera (HBAR) · Redis/Celery · Docker · GitHub Actions · React
- Built custodial wallet handling: registration provisions a Hedera account per user and project, private keys are encrypted at rest with Fernet, and donations and peer-to-peer transfers are signed server-side.
- Built the donation flow with HBAR transfers to project wallets, stored transaction hashes and status, and a transparency endpoint that re-verifies donations against Hedera Mirror Node data.
- Implemented JWT auth with mandatory email-OTP verification before login (Redis-stored OTPs with expiry, Celery and Brevo delivery) and donor, organization and admin roles gating project creation and verification.
- Containerized the backend with Docker Compose for dev, staging and production, with GitHub Actions CI and SSH-based deploys; built the React dashboard for donation history, analytics and reports.

JobHunter, *Job aggregation, CV matching and application automation API*
FastAPI · PostgreSQL · Celery/Redis · React
- Built an aggregation pipeline over seven job sources (six keyless APIs plus Adzuna), normalizing listings and upserting on source and external ID so repeat runs update instead of duplicating. Each source fails independently, so one outage doesn't stop a run.
- Built CV ingestion (PDF, DOCX, TXT, MD) with rule-based parsing and an optional LLM enrichment step that retries, falls back across models and repairs malformed JSON. Jobs are ranked with a weighted score: skills 60%, titles 25%, keywords 10%, remote preference 5%.

- Built the application workflow: a status-tracked pipeline, saved-search email alerts with provider fallback (SMTP, Brevo, dry-run), AI-assisted drafts, and auto-apply with daily caps and minimum match scores, all scoped per user and scheduled through Celery.
- Built the React client for search, CV library, match ranking and the application queue.

Backend Battle, *API load-testing and leaderboard platform*
FastAPI · async SQLAlchemy · httpx/asyncio · Celery/Redis · React Native
- Built an async load-testing engine that fires concurrent requests at any submitted endpoint (semaphore-bounded httpx) and records per-request latency, status and errors, then computes p50/p95/p99 latency, success rate and requests per second.
- Designed a weighted scoring model (average latency 40, p95 30, success rate 20, throughput 10) that maps each run to a letter grade, with a ranked leaderboard filterable by day, week and month.
- Ran benchmarks off the request path, as background tasks by default or through an optional Celery/Redis worker mode, with API-key auth, rate limiting, health checks and a React Native client that polls live runs.

EDUCATION

Babcock University, *Bachelor of Arts in Mass Communication*
